

Lab: SQL injection attack, querying the database type and version on MySQL and Microsoft

Open the burpsuite and turn on the intercept in the proxy. Click a different product type and send that request to the repeater. Click the any type of product and send the request to the repeater. To determine the numbers of columns being returned try the payload 'order+by+3# instead 'order+by+3-- since its microsoft database. Then try payload 'union+select+@@version,+null# to determine the type and version of the database.
